

DETECTION OF RESOURCE EXCEPTIONS

5 A method, computer program product and data processing
system for detecting resource exception errors. In one
embodiment of the present invention, a method comprises the
step of scanning for a method invocation used to open a
resource file. Upon identifying a method invocation, the
10 method further comprises scanning for a method signature, i.e.
pointer, associated with the identified method invocation.
The method signature points to the resource file to be opened
by the method invocation. The method further comprises the
step of scanning for a pair of string delimiters adjacent to
15 the method signature. The string within the pair of string
delimiters is a key to the resource file to be opened by the
method invocation. The method further comprises opening the
resource file using the method invocation previously
identified. Once the resource file is opened, the method
20 comprises the step of determining whether the key and the
value associated with the key are defined in the resource
file. If the key or its associated value is not defined in
the resource file, then a resource exception error is
detected. In another embodiment of the present invention, a
25 report may be generated where the report may comprise a
listing of all resource errors detected upon completing the
scanning the code.
